

Data Collection

Natalie Parde, Ph.D.

Department of Computer Science
University of Illinois at Chicago

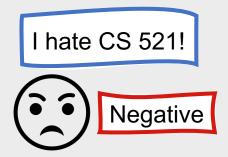

CS 521: Statistical Natural Language Processing
Spring 2024

Many slides adapted from: Pustejovsky, J., & Stubbs, A. (2012). *Natural Language Annotation for Machine Learning: A guide to corpusbuilding for applications*. O'Reilly Media, Inc.

What is data collection?

- The process of curating data and assigning labels to it
- Essential for statistical natural language processing!

Text collections for NLP tasks are typically referred to as corpora.

- Singular: Corpus
- Corpora come in many forms
 - Word-level annotations
 - Sentence-level annotations
 - Document-level annotations

Corpora can also focus on many different topics.

Sentiment Analysis

- ...and many more!

Why is data collection necessary?

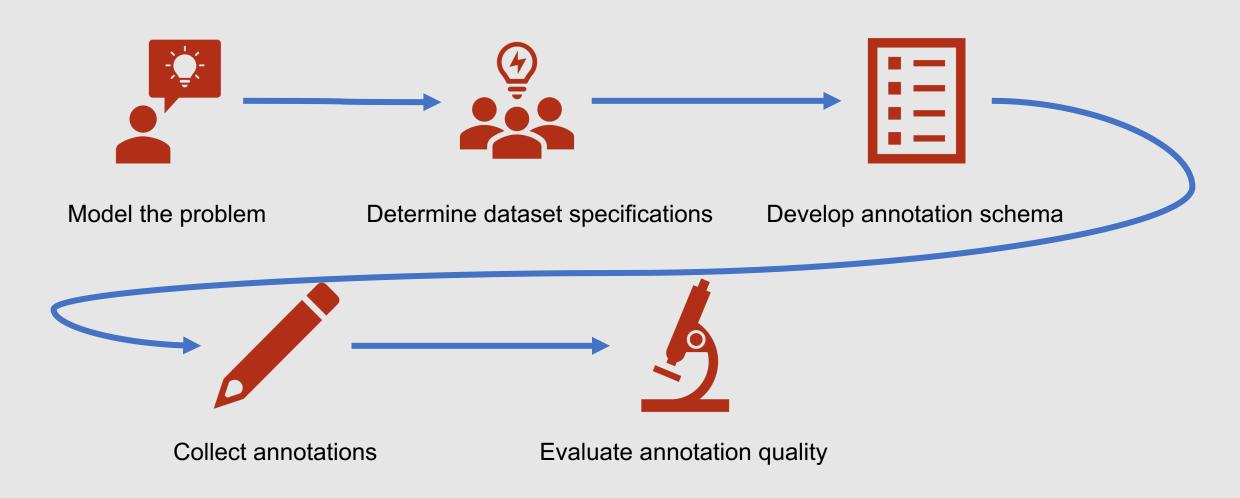

Would this answer be an example of a good response to this question?

Should this text be used to learn what a *positive* sample looks like?

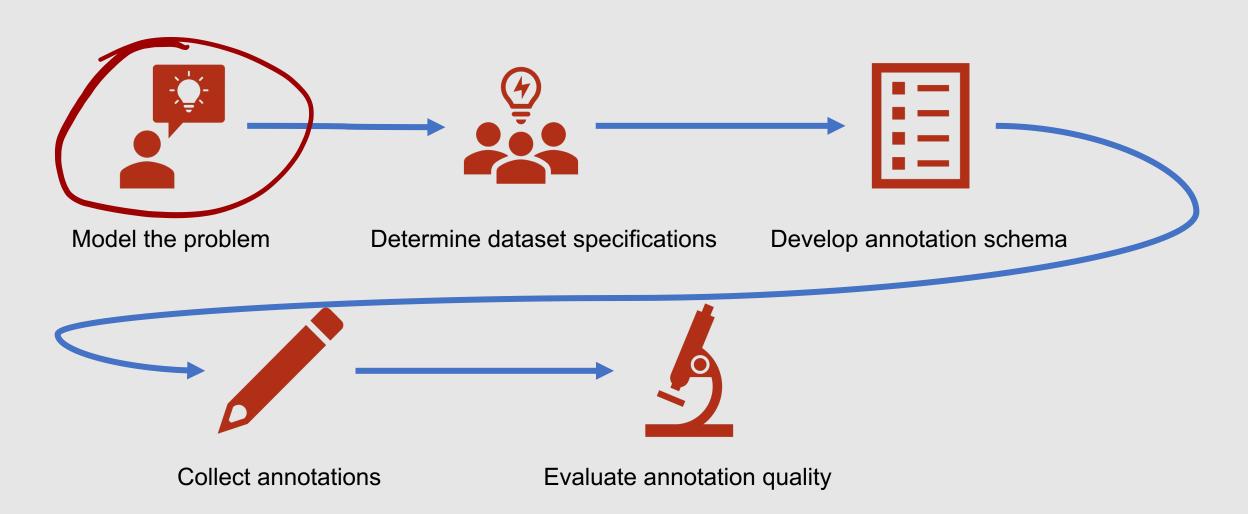

- Supervised learning algorithms require human assistance!
- Models need to know what to learn in order to succeed

Typical Data Collection Pipeline

Typical Data Collection Pipeline

Modeling the Problem

- Define a clear annotation goal for your task!
- Answer key questions:
 - What are you trying to do?
 - How are you trying to do it?
 - Which resources best fit your needs?
- Building a dataset is an iterative process ...your answers may change as you progress

Goal Definition

Write a statement of purpose

Expand upon how you will achieve it

Statement of Purpose

- 1-2 sentence summary describing intended line of research
- Break the task into manageable segments, if necessary
 - It may be unrealistic to collect annotations for everything of interest all at once

I want to create a program that can interpret and respond to metaphors, idioms, sarcasm, and jokes! I want to create a program that can categorize metaphors into different groups of conceptual mappings.

I want to create a program that can generate appropriate responses given specific metaphor categories.

Statement of Purpose

- 1-2 sentence summary describing intended line of research
- Break the task into manageable segments, if necessary
 - It may be unrealistic to collect annotations for everything of interest all at once

I want to create a program that can interpret and respond to metaphors, idioms, sarcasm, and jokes! want to create a program that can categorize metaphors into different groups of conceptual mappings.

want to create a program that can generate appropriate responses given specific metaphor categories.

When building out a longer task description....

Need to balance informativity vs. correctness

- High informativity: Annotations are very useful for your task
- High correctness: Annotation task is not difficult for annotators to complete accurately

Often the two are at odds with one another!

- With very precise categories (high informativity), annotators may easily miss the correct label or make labeling errors (low correctness)
- With limited categories (high correctness), labels may be less useful for the task of interest (low informativity)

These factors are closely related to project scope.

- Two main types of scope in this context:
 - Scope of the annotation task
 - How far-reaching is the annotation goal?
 - Scope of the corpus
 - How much will be covered?

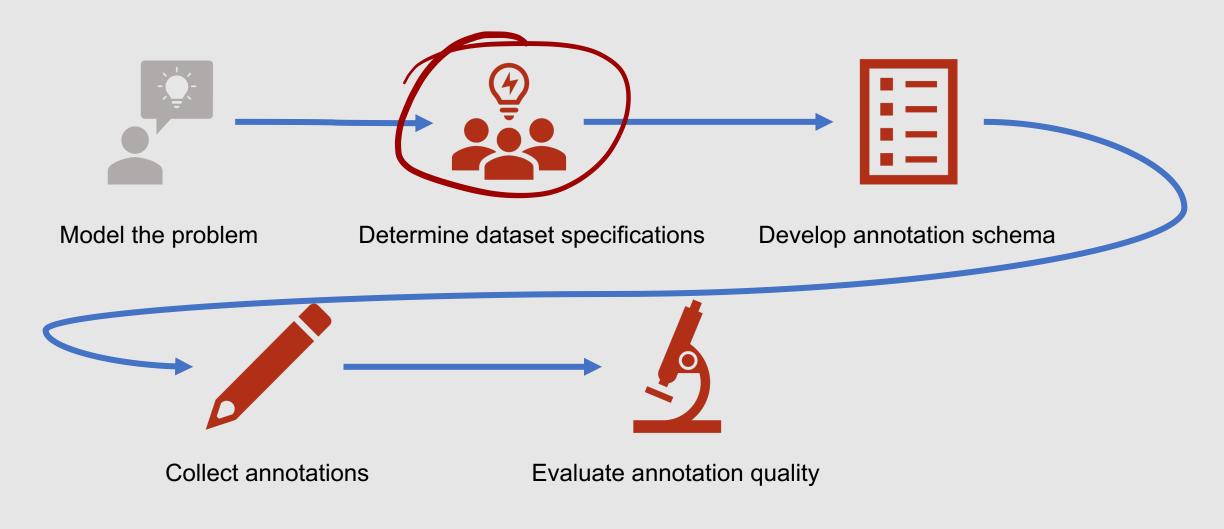

Scope of the Annotation Task

Define Define different possible categories of relationships Determine I Determine which will be most relevant to the task Think of the annotation task in terms of the classification task you are ultimately trying to solve Think • Note: Having many classes is not only difficult for annotators; it is also more challenging from a model training perspective

Scope of the Corpus

- What will be the data source(s)?
- Is a single source sufficient for developing generalizable methods for your task?
- Will your corpus need to cover multiple text styles (e.g., tweets and news articles) and/or genres (e.g., self-help and computer science)?
 - Do you need different annotation guidelines for different text styles/genres?

Typical Data Collection Pipeline

Dataset Specifications

- Conduct background research!
 - See what related corpora (if any) already exist for your task
 - Same task, different domain?
 - Same domain, different task?
- Review existing annotation schemes in areas close to your planned dataset

Where to look for related corpora?

Linguistic Data Consortium

 - https://semeval.github.io/SemEval2023/tasks
- CoNLL Shared Task
 - https://www.conll.org/previous-tasks

Determine Dataset Sources

- Ensure that sources are representative of the domain you're trying to model
- Make sure to fully document:
 - From where the data was obtained
 - Why it was selected
- Try to keep the corpus balanced across your desired annotation categories

Planning to make the dataset public?

- Make sure you have permission!
- Decide what type of license you will use

Common Data Sources in NLP

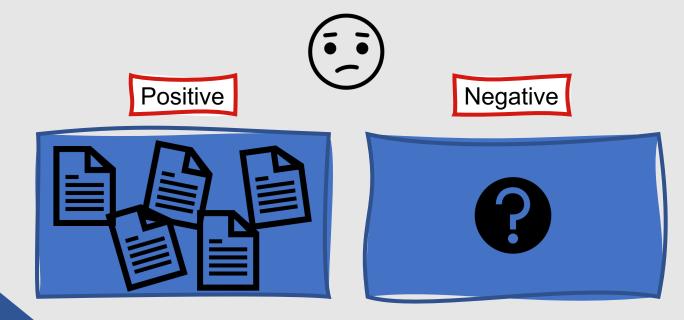

Collecting Data from People

- Usually requires IRB approval
 - May be eligible for a claim of exemption or require an expedited or full board review, depending on the nature of the data collected
 - https://research.uic.edu/compliance/humansubjects-irbs/
- May include read or spontaneous speech, written essays, or other requested language samples

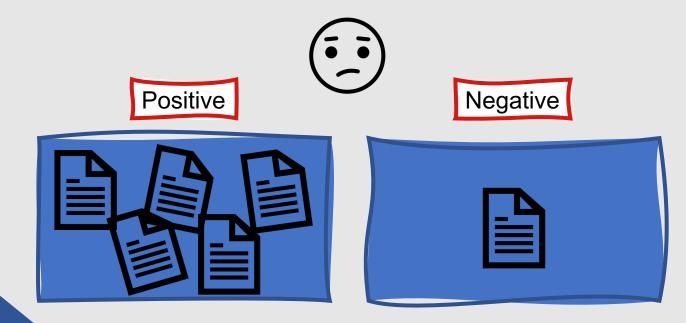

Achieving a Representative and Balanced Corpus Representative: The corpus contains samples of all text categories

Balanced: The corpus contains realistic (in many cases, equal is ideal) distributions of all text categories

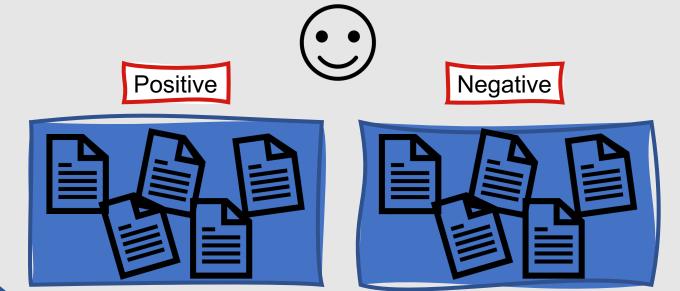

Achieving a Representative and Balanced Corpus Representative: The corpus contains samples of all text categories

Balanced: The corpus contains realistic (in many cases, equal is ideal) distributions of all text categories

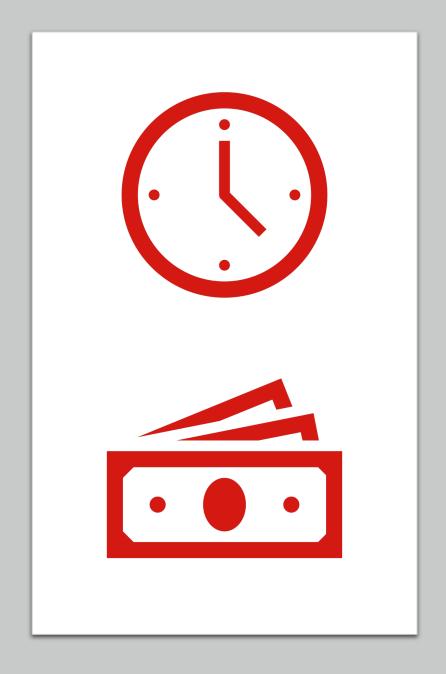

Achieving a Representative and Balanced Corpus Representative: The corpus contains samples of all text categories

Balanced: The corpus contains realistic (in many cases, equal is ideal) distributions of all text categories

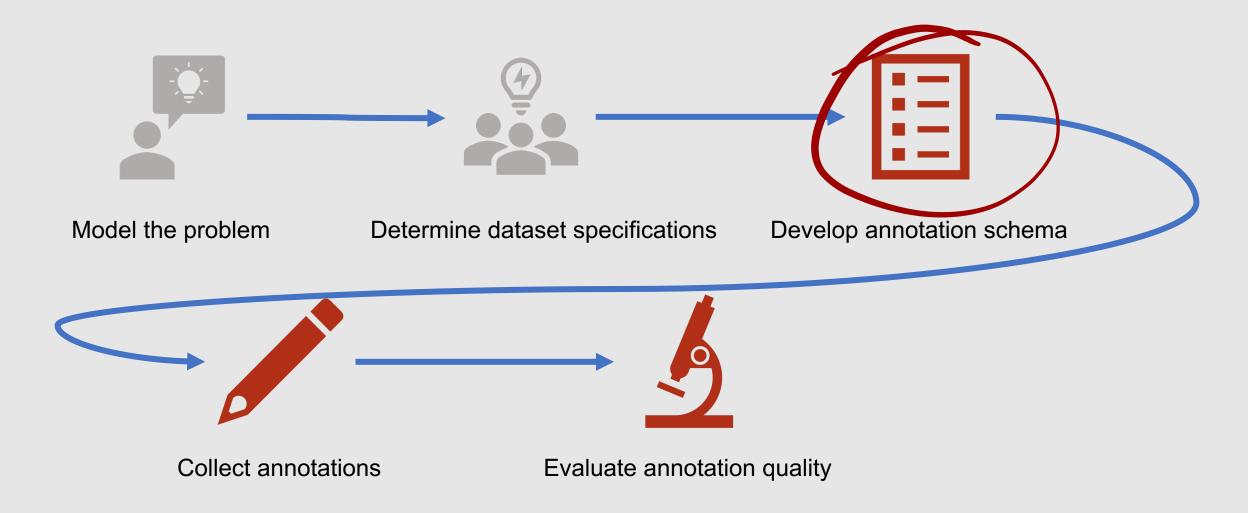

Corpus Size

- How much data are you going to collect and annotate?
 - Generally, more data → better
 - However, more data also → more time and money
- Start small and see how your annotation task and guidelines work before scaling up
- Refer to similar existing corpora to get a general idea of desired corpus size

Typical Data Collection Pipeline

You know what you want your annotators to do ...but how will they do it?

- What will the annotations look like?
- How are different types of tasks represented differently?
- How can you maximize your corpus's usefulness to the broader research community?
- What constraints are placed on your annotation environment and data format?
 - Consider both annotators and downstream machine learning task

Keep your data accessible!

Intricate database systems are difficult to set up (both for you, and for other people)

Complex XML schemas can be difficult for other researchers to understand

Defining Annotation Categories

Natalie wants to collect emotion labels for a classification task. She has a dataset of 1000 tweets, and wants to label each tweet with the most dominant emotion that it expresses.

I'm so happy I get to take CS 521!!!! #bestclassever

oh no I registered late and got stuck in CS 521 🔯

Wow I had no idea that UIC had a statistical NLP class 😮

Before she begins, she needs to decide on a reasonable set of annotation labels....

Natalie wants to collect emotion labels for a classification task. She has a dataset of 1000 tweets, and wants to label each tweet with the most dominant emotion that it expresses.

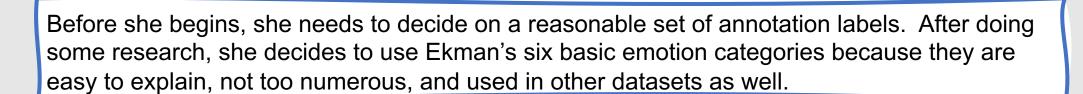

I'm so happy I get to take CS 521!!!! #bestclassever

oh no I registered late and got stuck in CS 521 6

Wow I had no idea that UIC had a statistical NLP class 😮

Happiness

Sadness

Surprise

Fear

Anger

Disgust

Natalie wants to collect emotion labels for a classification task. She has a dataset of 1000 tweets, and wants to label each tweet with the most dominant emotion that it expresses.

I'm so happy I get to take CS 521!!!! #bestclassever

oh no I registered late and got stuck in CS 521 6

Wow I had no idea that UIC had a statistical NLP class 😮

Happiness

Sadness

Surprise

Fear

Anger

Disgust

Now that she's decided on these labels, she needs to concisely define each one....

Natalie wants to collect emotion labels for a classification task. She has a dataset of 1000 tweets, and wants to label each tweet with the most dominant emotion that it expresses.

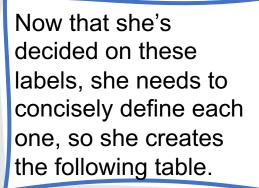

I'm so happy I get to take CS 521!!!! #bestclassever

oh no I registered late and got stuck in CS 521 6

Wow I had no idea that UIC had a statistical NLP class 😮

Happiness	Sadness	Surprise	Fear	Anger	Disgust
Indicates happiness or joy.	Indicates sadness or disappointment.	Indicates surprise or shock.	Indicates fear, stress, or panic.	Indicates anger or resentment.	Indicates disgust or unpleasantness.

Natalie wants to collect emotion labels for a classification task. She has a dataset of 1000 tweets, and wants to label each tweet with the most dominant emotion that it expresses.

I'm so happy I get to take CS 521!!!! #bestclassever

oh no I registered late and got stuck in CS 521 6

Wow I had no idea that UIC had a statistical NLP class 😮

To make sure her guidelines are clear, she also adds an example for each category.

Happiness	Sadness	Surprise	Fear	Anger	Disgust
Indicates happiness or joy.	Indicates sadness or disappointment.	Indicates surprise or shock.	Indicates fear, stress, or panic.	Indicates anger or resentment.	Indicates disgust or unpleasantness.
Yay I finished my homework three days before the deadline! #sohappy	I forgot to do a final project and failed my class	Wait there was an exam?!?!	Someone in this room just lost their tarantula so current status is terrified #omg	I am so mad that I have to retake this class for a fifth time	Ew gross there is mold on the wall

Be as concise as possible

Include Clear Instructions

Remember that your annotators will most likely be much less familiar with the task than you ...you may need to state things that seem obvious!

Natalie wants to collect emotion labels for a classification task. She has a dataset of 1000 tweets, and wants to label each tweet with the most dominant emotion that it expresses.

I'm so happy I get to take CS 521!!!! #bestclassever

oh no I registered late and got stuck in CS 521 💗

Wow I had no idea that UIC had a statistical NLP class 😮

Select the most dominant emotion expressed by the tweet below. Base your decision only on the information provided in the tweet text.

Happiness	Sadness	Surprise	Fear	Anger	Disgust
Indicates happiness or joy.	Indicates sadness or disappointment.	Indicates surprise or shock.	Indicates fear, stress, or panic.	Indicates anger or resentment.	Indicates disgust or unpleasantness.
Yay I finished my homework three days before the deadline! #sohappy	I forgot to do a final project and failed my class	Wait there was an exam?!?!	Someone in this room just lost their tarantula so current status is terrified #omg	I am so mad that I have to retake this class for a fifth time	Ew gross there is mold on the wall

Remember, developing a good annotation schema is often an iterative process!

- Start by giving your annotators a small sample of your data and checking:
 - Inter-annotator agreement
 - Agreement with what you'd like to see
- Ask annotators for preliminary feedback
 - Was there a category that seemed to be obviously missing?
 - Were there categories that seemed to overlap?
 - Was the annotation format reasonable?

Using the scheme she'd developed, Natalie collected annotations for 50 tweets. Her inter-annotator agreement was lower than expected, and a lot of tweets seemed to be incorrectly labeled with "happiness." She asked her annotators for some feedback.

Select the most dominant emotion expressed by the tweet below. Base your decision only on the information provided in the tweet text.

Happiness	Sadness	Surprise	Fear	Anger	Disgust
Indicates happiness or joy.	Indicates sadness or disappointment.	Indicates surprise or shock.	Indicates fear, stress, or panic.	Indicates anger or resentment.	Indicates disgust or unpleasantness.
Yay I finished my homework three days before the deadline! #sohappy	I forgot to do a final project and failed my class	Wait there was an exam?!?!	Someone in this room just lost their tarantula so current status is terrified #omg	I am so mad that I have to retake this class for a fifth time	Ew gross there is mold on the wall

Using the scheme she'd developed, Natalie collected annotations for 50 tweets. Her inter-annotator agreement was lower than expected, and a lot of tweets seemed to be incorrectly labeled with "happiness." She asked her annotators for some feedback.

Sometimes there didn't really seem to be any emotion expressed by the tweet, so I just chose "happiness."

I wasn't sure what the difference was between "surprise" and "fear."

Select the most dominant emotion expressed by the tweet below. Base your decision only on the information provided in the tweet text.

Happiness	Sadness	Surprise	Fear	Anger	Disgust
Indicates happiness or joy.	Indicates sadness or disappointment.	Indicates surprise or shock.	Indicates fear, stress, or panic.	Indicates anger or resentment.	Indicates disgust or unpleasantness.
Yay I finished my homework three days before the deadline! #sohappy	I forgot to do a final project and failed my class	Wait there was an exam?!?!	Someone in this room just lost their tarantula so current status is terrified #omg	I am so mad that I have to retake this class for a fifth time	Ew gross there is mold on the wall

Taking these descriptions into account, Natalie updated her description of "fear." She also added a new annotation category, "neutral."

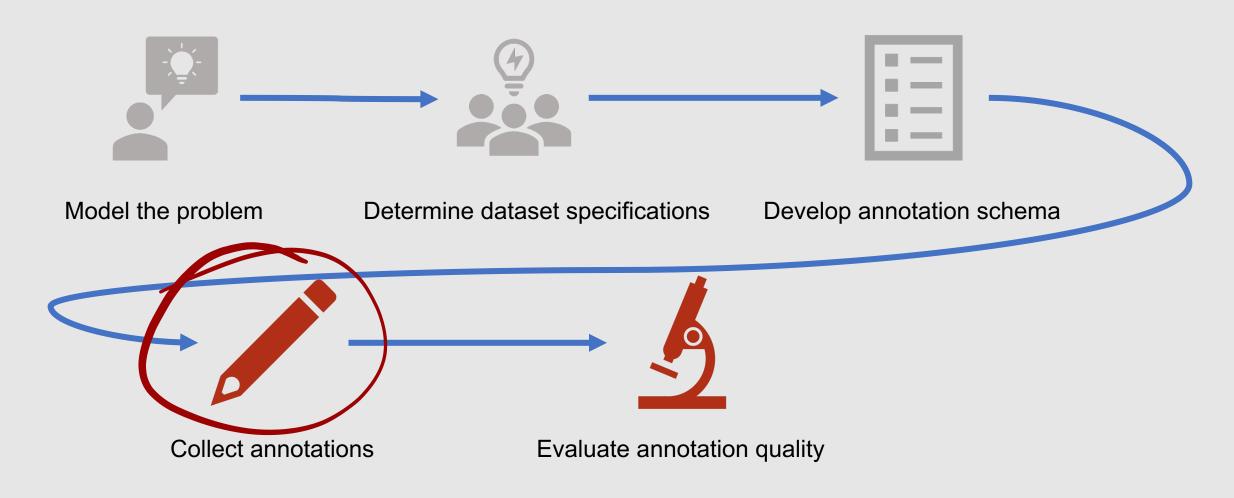

Select the most dominant emotion expressed by the tweet below. Base your decision only on the information provided in the tweet text.

Happiness	Sadness	Surprise	Fear	Anger	Disgust	Neutral
Indicates happiness or joy.	Indicates sadness or disappointment.	Indicates surprise or shock.	Indicates fear, terror, or dread.	Indicates anger or resentment.	Indicates disgust or unpleasantness.	Used no obvious emotion.
Yay I finished my homework three days before the deadline! #sohappy	I forgot to do a final project and failed my class	Wait there was an exam?!?!	Someone in this room just lost their tarantula so current status is terrified #omg	I am so mad that I have to retake this class for a fifth time	Ew gross there is mold on the wall	Slides from yesterday's class are available now.

For more tips on creating good annotation schema, check out guidelines for other popular corpora in your area.

- If there are well-defined standards in your annotation area, use those to the extent possible
- If you deviate from a well-defined standard, make sure to justify your reasons for doing so (others interested in using the corpus will probably ask)

Typical Data Collection Pipeline

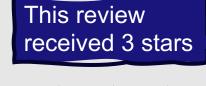

Preparing Data for Annotation

What information should you give your annotators?

Should they know the source of the text they are annotating?

Should they know the author of the text?

Should they have access to other metadata?

Eliminate biasing factors whenever possible!

Preprocessed Data

- Should you give annotators data that already has some information marked up?
 - Presenting annotators with too much information can lead to confusion
 - However, some information can be useful
- For some tasks, you can automatically assign labels and then ask annotators to correct them

Organizing Annotations

- Decide ahead of time how your annotations will be formatted and stored
 - Markup labels
 - CSV file
- Make sure you have a consistent internal system for linking annotations to source and metadata

Selecting Annotators

Does the annotation task require any specialized knowledge?

- Background expertise
- Language competency
- Demographic characteristics

What resources do you have available?

- Time
- Money
- Dataset size

Resource Availability

- Most people can only focus on an annotation task for a few hours at a time
- Annotators will get better at the task with practice
- Financial resources may limit your ability to hire experts

In-Person Annotators

Pros:

Generally available for longer periods of time

Can provide feedback one-on-one
Easier to provide with specific training

Cons:

Take longer to complete annotations

May be more subject to bias (e.g., from close knowledge of the project or the other annotators)

Crowdsourced Annotators

Pros:

Generally faster

Less likely to be biased by close knowledge of the project/other annotators

task
Cannot easily be traine

Cons:

Cannot easily be trained with task-specific knowledge

Generally less invested in the annotation

Minimal room for feedback

May only complete a small number of annotations

Where to find annotators?

In-Person:

- Friends
- Lab mates
- Undergraduates studying linguistics or psychology
- Individuals with task-specific expertise (e.g., medical doctors if annotations are needed for clinical notes)

Crowdsourced:

- Amazon Mechanical Turk: https://www.mturk.com/
- Appen: https://appen.com/crowd-2
- Prolific: https://www.prolific.com/

52

Natalie Parde - UIC CS 521

Annotation Environments

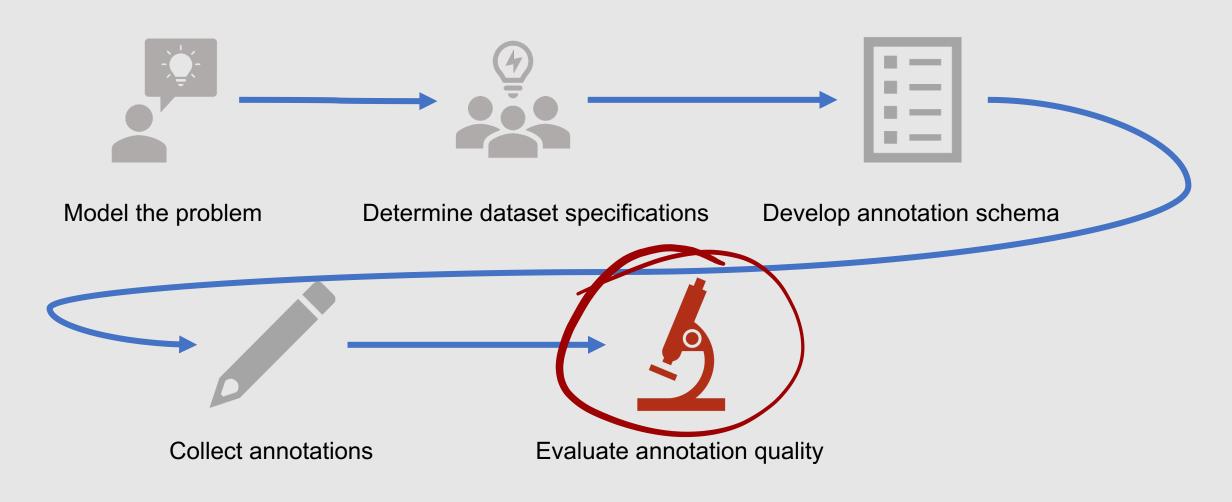

- Many different tools exist!
- Popular, actively updated platforms:
 - General Architecture for Text Engineering (GATE)
 - https://gate.ac.uk/sale/tao/split.html
 - INCEpTION
 - https://inception-project.github.io/
 - BRAT
 - https://brat.nlplab.org/

Key Considerations

- Make sure that the annotation environment:
 - Works on all the computers you and your annotators will be using
 - Supports the type of annotations you need
 - Includes any extra support features you need
- Don't neglect UI elements!
 - Try to ensure that your annotation guidelines are easily accessible
 - Make sure that the environment is easy to install and easy to use

Typical Data Collection Pipeline

Inter-Annotator Agreement (IAA)

- Collect labels from multiple annotators for the same data instances
- Determine how well the annotators agreed with one another
- Why is this important?
 - Good IAA scores ensure that:
 - Your annotation scheme effectively models your problem
 - Your work is reproducible

How is IAA computed?

Percent agreement?

Doesn't consider random chance agreement

Most common metrics:

- Cohen's Kappa
- Krippendorff's Alpha

Cohen's Kappa

 Measures the agreement between two annotators, while considering the possibility of chance agreement

•
$$\kappa = \frac{p_r - p_e}{1 - p_e}$$

• where p_r is the relative observed agreement between annotators, and p_e is the expected agreement between annotators, if each selected a label randomly

Interpreting Kappa Values

- What is a "good" kappa value?
 - Depends on the task complexity and objectivity
- In general, most researchers adhere to the following (Landis and Koch, 1977):
 - $\kappa \leq 0$: Poor agreement
 - $0.00 < \kappa < 0.20$: Slight agreement
 - $0.20 \le \kappa < 0.40$: Fair agreement
 - $0.40 \le \kappa < 0.60$: Moderate agreement
 - $0.60 \le \kappa < 0.80$: Substantial agreement
 - $0.80 \le \kappa$: Perfect (or at least, extremely good) agreement

What if each instance was annotated by more than two annotators?

Krippendorff's Alpha

•
$$\alpha = \frac{p_{\alpha} - p_e}{1 - p_e}$$

- where p_{α} is a weighted percent agreement, and p_e is a weighted percent chance agreement
- Allows for ignoring missing or incomplete annotations
- Score range: -1 to 1

Creating a Gold Standard

Once you're satisfied with your IAA scores, how do you select final labels for data that has been annotated by multiple people?

If in agreement, use that label

If in disagreement, adjudicate!

Select an adjudicator who is already very familiar with the task (usually someone who was involved in creating the annotation guidelines)

Adjudication Guidelines

- Allocate plenty of time for adjudication
- Don't feel pressured to go with the majority, in cases with more than two annotators
 - Annotators may have agreed due to random chance
- If using multiple adjudicators, compute IAA between them to make sure they're on the right track

After your data has been adjudicated, your corpus is complete!

Make sure to document the process well

If publishing the corpus, make sure the data and annotations are in a clean, organized format that is easy to use by other researchers

Summary: Data Collection

- Data collection is the process of curating data and assigning labels to it
- Data can be collected from existing text, recordings, or other online samples, or it can be collected directly from people completing a specific task
- Annotations can be collected from in-person annotators, or crowdsourced online
- Inter-annotator agreement (IAA) indicates how well individual annotators agreed with one another when labeling a dataset
- A common metric for computing IAA is Cohen's Kappa
- Once all data has been collected, an adjudicator determines the final labels for instances about which individual annotators disagreed
- The final set of adjudicated labels is referred to as the gold standard
